## 1. INJECTIVE SPACES

The following propositions are true:

- (1) For every point  $p$  of the Sierpiński space such that  $p = 0$  holds  $\{p\}$  is closed.
- (2) For every point  $p$  of the Sierpiński space such that  $p = 1$  holds  $\{p\}$  is non closed.

Let us observe that the Sierpiński space is non  $T_1$ .

Let us note that every top-lattice which is complete and Scott is also discernible.

Let us mention that there exists a  $T_0$ -space which is injective and strict.

Let us note that there exists a top-lattice which is complete, Scott, and strict.

The following propositions are true:

- (3) Let  $I$  be a non empty set and  $T$  be a Scott topological augmentation of  $\prod(I \mapsto 2^1_{\subseteq})$ . Then the carrier of  $T =$  the carrier of  $\prod(I \mapsto$  the Sierpiński space).
- (4) Let  $L_1, L_2$  be complete lattices,  $T_1$  be a Scott topological augmentation of  $L_1$ ,  $T_2$  be a Scott topological augmentation of  $L_2$ ,  $h$  be a map from  $L_1$  into  $L_2$ , and  $H$  be a map from  $T_1$  into  $T_2$ . If  $h = H$  and  $h$  is isomorphic, then  $H$  is a homeomorphism.
- (5) Let  $L_1, L_2$  be complete lattices,  $T_1$  be a Scott topological augmentation of  $L_1$ , and  $T_2$  be a Scott topological augmentation of  $L_2$ . If  $L_1$  and  $L_2$  are isomorphic, then  $T_1$  and  $T_2$  are homeomorphic.
- (6) Let  $S, T$  be non empty topological spaces. If  $S$  is injective and  $S$  and  $T$  are homeomorphic, then  $T$  is injective.
- (7) Let  $L_1, L_2$  be complete lattices,  $T_1$  be a Scott topological augmentation of  $L_1$ , and  $T_2$  be a Scott topological augmentation of  $L_2$ . If  $L_1$  and  $L_2$  are isomorphic and  $T_1$  is injective, then  $T_2$  is injective.

Let  $X, Y$  be non empty topological spaces. Let us observe that  $X$  is a topological retract of  $Y$  if and only if:

---

<sup>1</sup>This work has been supported by KBN Grant 8 T11C 018 12.

(Def. 1) There exists a continuous map  $c$  from  $X$  into  $Y$  and there exists a continuous map  $r$  from  $Y$  into  $X$  such that  $r \cdot c = \text{id}_X$ .

Next we state several propositions:

- (8) Let  $S, T, X, Y$  be non empty topological spaces. Suppose that
- (i) the topological structure of  $S =$  the topological structure of  $T$ ,
  - (ii) the topological structure of  $X =$  the topological structure of  $Y$ , and
  - (iii)  $S$  is a topological retract of  $X$ .
- Then  $T$  is a topological retract of  $Y$ .
- (9) Let  $T, S_1, S_2$  be non empty topological structures. Suppose  $S_1$  and  $S_2$  are homeomorphic and  $S_1$  is a topological retract of  $T$ . Then  $S_2$  is a topological retract of  $T$ .
- (10) Let  $S, T$  be non empty topological spaces. Suppose  $T$  is injective and  $S$  is a topological retract of  $T$ . Then  $S$  is injective.
- (11) Let  $J$  be an injective non empty topological space and  $Y$  be a non empty topological space. If  $J$  is a subspace of  $Y$ , then  $J$  is a topological retract of  $Y$ .
- (12) For every complete continuous lattice  $L$  holds every Scott topological augmentation of  $L$  is injective.

Let  $L$  be a complete continuous lattice. Note that every topological augmentation of  $L$  which is Scott is also injective.

Let  $T$  be an injective non empty topological space. Note that the topological structure of  $T$  is injective.

## 2. SPECIALIZATION ORDER

Let  $T$  be a topological structure. The functor  $\Omega T$  yields a strict FR-structure and is defined by the conditions (Def. 2).

- (Def. 2)(i) The topological structure of  $\Omega T =$  the topological structure of  $T$ , and
- (ii) for all elements  $x, y$  of  $\Omega T$  holds  $x \leq y$  iff there exists a subset  $Y$  of  $T$  such that  $Y = \{y\}$  and  $x \in \bar{Y}$ .

Let  $T$  be an empty topological structure. Observe that  $\Omega T$  is empty.

Let  $T$  be a non empty topological structure. One can check that  $\Omega T$  is non empty.

Let  $T$  be a topological space. One can check that  $\Omega T$  is topological space-like.

Let  $T$  be a topological structure. Note that  $\Omega T$  is reflexive.

Let  $T$  be a topological structure. Observe that  $\Omega T$  is transitive.

Let  $T$  be a  $T_0$ -space. One can verify that  $\Omega T$  is antisymmetric.

We now state four propositions:

- (13) Let  $S, T$  be topological spaces. Suppose the topological structure of  $S =$  the topological structure of  $T$ . Then  $\Omega S = \Omega T$ .
- (14) Let  $M$  be a non empty set and  $T$  be a non empty topological space. Then the relational structure of  $\Omega \prod(M \mapsto T) =$  the relational structure of  $\prod(M \mapsto \Omega T)$ .
- (15) For every Scott complete top-lattice  $S$  holds  $\Omega S =$  the FR-structure of  $S$ .
- (16) Let  $L$  be a complete lattice and  $S$  be a Scott topological augmentation of  $L$ . Then the relational structure of  $\Omega S =$  the relational structure of  $L$ .

Let  $S$  be a Scott complete top-lattice. Observe that  $\Omega S$  is complete.

We now state four propositions:

- (17) Let  $T$  be a non empty topological space and  $S$  be a non empty subspace of  $T$ . Then  $\Omega S$  is a full relational substructure of  $\Omega T$ .
- (18) Let  $S, T$  be topological spaces,  $h$  be a map from  $S$  into  $T$ , and  $g$  be a map from  $\Omega S$  into  $\Omega T$ . If  $h = g$  and  $h$  is a homeomorphism, then  $g$  is isomorphic.
- (19) For all topological spaces  $S, T$  such that  $S$  and  $T$  are homeomorphic holds  $\Omega S$  and  $\Omega T$  are isomorphic.
- (20) For every injective  $T_0$ -space  $T$  holds  $\Omega T$  is a complete continuous lattice.

Let  $T$  be an injective  $T_0$ -space. Note that  $\Omega T$  is complete and continuous.  
The following proposition is true

- (21) For all non empty topological spaces  $X, Y$  holds every continuous map from  $\Omega X$  into  $\Omega Y$  is monotone.

Let  $X, Y$  be non empty topological spaces. Note that every map from  $\Omega X$  into  $\Omega Y$  which is continuous is also monotone.

The following proposition is true

- (22) For every non empty topological space  $T$  and for every element  $x$  of  $\Omega T$  holds  $\overline{\{x\}} = \downarrow x$ .

Let  $T$  be a non empty topological space and let  $x$  be an element of  $\Omega T$ . Note that  $\overline{\{x\}}$  is non empty, lower, and directed and  $\downarrow x$  is closed.

One can prove the following proposition

- (23) For every topological space  $X$  holds every open subset of  $\Omega X$  is upper.

Let  $T$  be a topological space. Observe that every subset of  $\Omega T$  which is open is also upper.

Let  $I$  be a non empty set, let  $S, T$  be non empty relational structures, let  $N$  be a net in  $T$ , and let  $i$  be an element of  $I$ . Let us assume that the carrier of  $T \subseteq$  the carrier of  $S^I$ . The functor  $\text{commute}(N, i, S)$  yields a strict net in  $S$  and is defined by the conditions (Def. 3).

- (Def. 3)(i) The relational structure of  $\text{commute}(N, i, S) =$  the relational structure of  $N$ , and  
(ii) the mapping of  $\text{commute}(N, i, S) = (\text{commute}(\text{the mapping of } N))(i)$ .

Next we state two propositions:

- (24) Let  $X, Y$  be non empty topological spaces,  $N$  be a net in  $[X \rightarrow \Omega Y]$ ,  $i$  be an element of  $N$ , and  $x$  be a point of  $X$ . Then  $(\text{the mapping of } \text{commute}(N, x, \Omega Y))(i) = (\text{the mapping of } N)(i)(x)$ .
- (25) Let  $X, Y$  be non empty topological spaces,  $N$  be an eventually-directed net in  $[X \rightarrow \Omega Y]$ , and  $x$  be a point of  $X$ . Then  $\text{commute}(N, x, \Omega Y)$  is eventually-directed.

Let  $X, Y$  be non empty topological spaces, let  $N$  be an eventually-directed net in  $[X \rightarrow \Omega Y]$ , and let  $x$  be a point of  $X$ . Note that  $\text{commute}(N, x, \Omega Y)$  is eventually-directed.

Let  $X, Y$  be non empty topological spaces. Note that every net in  $[X \rightarrow \Omega Y]$  is function yielding.  
We now state the proposition

- (26) Let  $X$  be a non empty topological space,  $Y$  be a  $T_0$ -space, and  $N$  be a net in  $[X \rightarrow \Omega Y]$ . Suppose that for every point  $x$  of  $X$  holds  $\text{sup } \text{commute}(N, x, \Omega Y)$  exists. Then  $\text{sup rng}(\text{the mapping of } N)$  exists in  $(\Omega Y)^{\text{the carrier of } X}$ .

## 3. MONOTONE CONVERGENCE TOPOLOGICAL SPACES

Let  $T$  be a non empty topological space. We say that  $T$  is monotone convergence if and only if the condition (Def. 4) is satisfied.

(Def. 4) Let  $D$  be a non empty directed subset of  $\Omega T$ . Then  $\sup D$  exists in  $\Omega T$  and for every open subset  $V$  of  $T$  such that  $\sup D \in V$  holds  $D$  meets  $V$ .

Next we state the proposition

(27) Let  $S, T$  be non empty topological spaces. Suppose the topological structure of  $S =$  the topological structure of  $T$  and  $S$  is monotone convergence. Then  $T$  is monotone convergence.

One can check that every  $T_0$ -space which is trivial is also monotone convergence.

Let us observe that there exists a topological space which is strict, trivial, and non empty.

The following two propositions are true:

(28) Let  $S$  be a monotone convergence  $T_0$ -space and  $T$  be a  $T_0$ -space. If  $S$  and  $T$  are homeomorphic, then  $T$  is monotone convergence.

(29) Every Scott complete top-lattice is monotone convergence.

Let  $L$  be a complete lattice. One can verify that every Scott topological augmentation of  $L$  is monotone convergence.

Let  $L$  be a complete lattice and let  $S$  be a Scott topological augmentation of  $L$ . Note that the topological structure of  $S$  is monotone convergence.

We now state the proposition

(30) For every monotone convergence  $T_0$ -space  $X$  holds  $\Omega X$  is up-complete.

Let  $X$  be a monotone convergence  $T_0$ -space. Note that  $\Omega X$  is up-complete.

The following three propositions are true:

(31) Let  $X$  be a monotone convergence non empty topological space and  $N$  be an eventually-directed prenet over  $\Omega X$ . Then  $\sup N$  exists.

(32) Let  $X$  be a monotone convergence non empty topological space and  $N$  be an eventually-directed net in  $\Omega X$ . Then  $\sup N \in \text{Lim} N$ .

(33) For every monotone convergence non empty topological space  $X$  holds every eventually-directed net in  $\Omega X$  is convergent.

Let  $X$  be a monotone convergence non empty topological space. One can check that every eventually-directed net in  $\Omega X$  is convergent.

We now state two propositions:

(34) Let  $X$  be a non empty topological space. Suppose that for every eventually-directed net  $N$  in  $\Omega X$  holds  $\sup N$  exists and  $\sup N \in \text{Lim} N$ . Then  $X$  is monotone convergence.

(35) Let  $X$  be a monotone convergence non empty topological space and  $Y$  be a  $T_0$ -space. Then every continuous map from  $\Omega X$  into  $\Omega Y$  is directed-sups-preserving.

Let  $X$  be a monotone convergence non empty topological space and let  $Y$  be a  $T_0$ -space. Note that every map from  $\Omega X$  into  $\Omega Y$  which is continuous is also directed-sups-preserving.

One can prove the following four propositions:

(36) Let  $T$  be a monotone convergence  $T_0$ -space and  $R$  be a  $T_0$ -space. If  $R$  is a topological retract of  $T$ , then  $R$  is monotone convergence.

(37) Let  $T$  be an injective  $T_0$ -space and  $S$  be a Scott topological augmentation of  $\Omega T$ . Then the topological structure of  $S =$  the topological structure of  $T$ .

- (38) Every injective  $T_0$ -space is compact, locally-compact, and sober.  
 (39) Every injective  $T_0$ -space is monotone convergence.

Let us note that every  $T_0$ -space which is injective is also monotone convergence.  
 We now state four propositions:

- (40) Let  $X$  be a non empty topological space,  $Y$  be a monotone convergence  $T_0$ -space,  $N$  be a net in  $[X \rightarrow \Omega Y]$ , and  $f, g$  be maps from  $X$  into  $\Omega Y$ . Suppose that
- (i)  $f = \bigsqcup_{((\Omega Y)^{\text{the carrier of } X})} \text{rng}(\text{the mapping of } N)$ ,
  - (ii)  $\sup \text{rng}(\text{the mapping of } N)$  exists in  $(\Omega Y)^{\text{the carrier of } X}$ , and
  - (iii)  $g \in \text{rng}(\text{the mapping of } N)$ .
- Then  $g \leq f$ .
- (41) Let  $X$  be a non empty topological space,  $Y$  be a monotone convergence  $T_0$ -space,  $N$  be a net in  $[X \rightarrow \Omega Y]$ ,  $x$  be a point of  $X$ , and  $f$  be a map from  $X$  into  $\Omega Y$ . Suppose for every point  $a$  of  $X$  holds  $\text{commute}(N, a, \Omega Y)$  is eventually-directed and  $f = \bigsqcup_{((\Omega Y)^{\text{the carrier of } X})} \text{rng}(\text{the mapping of } N)$ . Then  $f(x) = \sup \text{commute}(N, x, \Omega Y)$ .
- (42) Let  $X$  be a non empty topological space,  $Y$  be a monotone convergence  $T_0$ -space, and  $N$  be a net in  $[X \rightarrow \Omega Y]$ . Suppose that for every point  $x$  of  $X$  holds  $\text{commute}(N, x, \Omega Y)$  is eventually-directed. Then  $\bigsqcup_{((\Omega Y)^{\text{the carrier of } X})} \text{rng}(\text{the mapping of } N)$  is a continuous map from  $X$  into  $Y$ .
- (43) Let  $X$  be a non empty topological space and  $Y$  be a monotone convergence  $T_0$ -space. Then  $[X \rightarrow \Omega Y]$  is a directed-sups-inheriting relational substructure of  $(\Omega Y)^{\text{the carrier of } X}$ .
