# Introduction to Turing Machines 

Jing-Chao Chen<br>Bell Labs Research China<br>Lucent Technologies<br>Bejing

Yatsuka Nakamura<br>Shinshu University<br>Nagano

Summary. A Turing machine can be viewed as a simple kind of computer, whose operations are constrainted to reading and writing symbols on a tape, or moving along the tape to the left or right. In theory, one has proven that the computability of Turing machines is equivalent to recursive functions. This article defines and verifies the Turing machines of summation and three primitive functions which are successor, zero and project functions. It is difficult to compute sophisticated functions by simple Turing machines. Therefore, we define the combination of two Turing machines.

MML Identifier: TURING_1.

The notation and terminology used in this paper are introduced in the following articles: [3], [4], [13], [2], [5], [18], [14], [6], [7], [8], [12], [17], [16], [1], [11], [20], [10], [19], [15], and [9].

## 1. Preliminaries

In this paper $n, i, j, k$ denote natural numbers.
Let $A, B$ be non empty sets, let $f$ be a function from $A$ into $B$, and let $g$ be a partial function from $A$ to $B$. Then $f+\cdot g$ is a function from $A$ into $B$.

Let $X, Y$ be non empty sets, let $a$ be an element of $X$, and let $b$ be an element of $Y$. Then $a \longmapsto b$ is a partial function from $X$ to $Y$.

Let $n$ be a natural number. The functor $\operatorname{Seg}_{M} n$ yielding a subset of $\mathbb{N}$ is defined as follows:
(Def. 1) $\operatorname{Seg}_{M} n=\{k: k \leqslant n\}$.

Let $n$ be a natural number. One can verify that $\operatorname{Seg}_{M} n$ is finite and non empty.

One can prove the following propositions:
(1) $k \in \operatorname{Seg}_{M} n$ iff $k \leqslant n$.
(2) For every function $f$ and for all sets $x, y, z, u, v$ such that $u \neq x$ holds $(f+\cdot(\langle x, y\rangle \longmapsto z))(\langle u, v\rangle)=f(\langle u, v\rangle)$.
(3) For every function $f$ and for all sets $x, y, z, u, v$ such that $v \neq y$ holds $(f+\cdot(\langle x, y\rangle \longmapsto z))(\langle u, v\rangle)=f(\langle u, v\rangle)$.
In the sequel $i_{1}, i_{2}, i_{3}, i_{4}$ denote elements of $\mathbb{Z}$.
We now state three propositions:
(4) $\sum\left\langle i_{1}, i_{2}\right\rangle=i_{1}+i_{2}$.
(5) $\sum\left\langle i_{1}, i_{2}, i_{3}\right\rangle=i_{1}+i_{2}+i_{3}$.
(6) $\sum\left\langle i_{1}, i_{2}, i_{3}, i_{4}\right\rangle=i_{1}+i_{2}+i_{3}+i_{4}$.

Let $f$ be a finite sequence of elements of $\mathbb{N}$ and let $i$ be a natural number. The functor $\operatorname{Prefix}(f, i)$ yields a finite sequence of elements of $\mathbb{Z}$ and is defined by:
(Def. 2) $\quad \operatorname{Prefix}(f, i)=f \upharpoonright \operatorname{Seg} i$.
Next we state two propositions:
(7) For all natural numbers $x_{1}, x_{2}$ holds $\sum \operatorname{Prefix}\left(\left\langle x_{1}, x_{2}\right\rangle, 1\right)=x_{1}$ and $\sum \operatorname{Prefix}\left(\left\langle x_{1}, x_{2}\right\rangle, 2\right)=x_{1}+x_{2}$.
(8) For all natural numbers $x_{1}, x_{2}, x_{3}$ holds $\sum \operatorname{Prefix}\left(\left\langle x_{1}, x_{2}, x_{3}\right\rangle, 1\right)=x_{1}$ and $\sum \operatorname{Prefix}\left(\left\langle x_{1}, x_{2}, x_{3}\right\rangle, 2\right)=x_{1}+x_{2}$ and $\sum \operatorname{Prefix}\left(\left\langle x_{1}, x_{2}, x_{3}\right\rangle, 3\right)=x_{1}+$ $x_{2}+x_{3}$.

## 2. Definitions and Terminology for Turing Machine

We consider Turing machine structures as systems
〈 symbols, control states, a transition, an initial state, an accepting state〉, where the symbols and the control states constitute finite non empty sets, the transition is a function from : the control states, the symbols : into : the control states, the symbols, $\{-1,0,1\}:]$, and the initial state and the accepting state are elements of the control states.

Let $T$ be a Turing machine structure. A state of $T$ is an element of the control states of $T$. A tape of $T$ is an element of (the symbols of $T)^{\mathbb{Z}}$. A symbol of $T$ is an element of the symbols of $T$.

Let $T$ be a Turing machine structure, let $t$ be a tape of $T$, let $h$ be an integer, and let $s$ be a symbol of $T$. The functor Tape- $\operatorname{Chg}(t, h, s)$ yields a tape of $T$ and is defined as follows:
(Def. 3) Tape-Chg $(t, h, s)=t+\cdot(h \longmapsto s)$.
Let $T$ be a Turing machine structure. A State of $T$ is an element of $:$ the control states of $T, \mathbb{Z}$, (the symbols of $T)^{\mathbb{Z}}:$. A transition-source of $T$ is an element of : the control states of $T$, the symbols of $T$ :]. A transition-target of $T$ is an element of $:$ the control states of $T$, the symbols of $T,\{-1,0,1\}:]$.

Let $T$ be a Turing machine structure and let $g$ be a transition-target of $T$. The functor offset $(g)$ yields an integer and is defined as follows:
(Def. 4) offset $(g)=g_{\mathbf{3}}$.
Let $T$ be a Turing machine structure and let $s$ be a State of $T$. The functor $\operatorname{Head}(s)$ yielding an integer is defined by:
(Def. 5) $\operatorname{Head}(s)=s_{\mathbf{2}}$.
Let $T$ be a Turing machine structure and let $s$ be a State of $T$. The functor $s$-target yielding a transition-target of $T$ is defined by:
(Def. 6) $s$-target $=($ the transition of $T)\left(\left\langle s_{\mathbf{1}},\left(s_{\mathbf{3}}\right.\right.\right.$ qua tape of $\left.\left.\left.T\right)(\operatorname{Head}(s))\right\rangle\right)$.
Let $T$ be a Turing machine structure and let $s$ be a State of $T$. The functor Following $(s)$ yields a State of $T$ and is defined as follows:
$\left(\right.$ Def. 7) Following $(s)=\left\{\begin{array}{c}\left\langle s-\operatorname{target}_{\mathbf{1}}, \operatorname{Head}(s)+\operatorname{offset}(s \text {-target }),\right. \\ \left.\operatorname{Tape}-\operatorname{Chg}\left(s_{\mathbf{3}}, \operatorname{Head}(s), s \text {-target } \mathbf{2}_{\mathbf{2}}\right)\right\rangle, \\ \text { if } s_{\mathbf{1}} \neq \operatorname{the} \operatorname{accepting} \text { state of } T, \\ s, \text { otherwise. }\end{array}\right.$
Let $T$ be a Turing machine structure and let $s$ be a State of $T$. The functor Computation $(s)$ yielding a function from $\mathbb{N}$ into : the control states of $T, \mathbb{Z}$, (the symbols of $T)^{\mathbb{Z}}$ : is defined as follows:
(Def. 8) $\quad(\operatorname{Computation}(s))(0)=s$ and for every $i$ holds $(\operatorname{Computation}(s))(i+1)=$ Following $((\operatorname{Computation}(s))(i))$.
In the sequel $T$ is a Turing machine structure and $s$ is a State of $T$.
The following propositions are true:
(9) Let $T$ be a Turing machine structure and $s$ be a State of $T$. If $s_{\mathbf{1}}=$ the accepting state of $T$, then $s=$ Following $(s)$.
(10) $\quad(\operatorname{Computation}(s))(0)=s$.
(11) $\quad(\operatorname{Computation}(s))(k+1)=\operatorname{Following}((\operatorname{Computation}(s))(k))$.
(12) $\quad($ Computation $(s))(1)=$ Following $(s)$.
(13) $\quad(\operatorname{Computation}(s))(i+k)=(\operatorname{Computation}((\operatorname{Computation}(s))(i)))(k)$.
(14) If $i \leqslant j$ and Following $((\operatorname{Computation}(s))(i))=(\operatorname{Computation}(s))(i)$, then $(\operatorname{Computation}(s))(j)=($ Computation $(s))(i)$.
(15) If $i \leqslant j$ and (Computation $(s))(i)_{\mathbf{1}}=$ the accepting state of $T$, then $($ Computation $(s))(j)=(\operatorname{Computation}(s))(i)$.
Let $T$ be a Turing machine structure and let $s$ be a State of $T$. We say that $s$ is accepting if and only if:
(Def. 9) There exists $k$ such that (Computation $(s))(k)_{\mathbf{1}}=$ the accepting state of $T$.

Let $T$ be a Turing machine structure and let $s$ be a State of $T$. Let us assume that $s$ is accepting. The functor Result $(s)$ yielding a State of $T$ is defined by:
(Def. 10) There exists $k$ such that $\operatorname{Result}(s)=(\operatorname{Computation}(s))(k)$ and (Computation $(s))(k)_{\mathbf{1}}=$ the accepting state of $T$.
We now state the proposition
(16) Let $T$ be a Turing machine structure and $s$ be a State of $T$. Suppose $s$ is accepting. Then there exists a natural number $k$ such that
(i) $\quad($ Computation $(s))(k)_{\mathbf{1}}=$ the accepting state of $T$,
(ii) $\operatorname{Result}(s)=(\operatorname{Computation}(s))(k)$, and
(iii) for every natural number $i$ such that $i<k$ holds (Computation(s)) $(i)_{\mathbf{1}} \neq$ the accepting state of $T$.

Let $A, B$ be non empty sets and let $y$ be a set. Let us assume that $y \in B$. The functor $\operatorname{id}(A, B, y)$ yields a function from $A$ into $: A, B:$ and is defined as follows:
(Def. 11) For every element $x$ of $A$ holds $(i d(A, B, y))(x)=\langle x, y\rangle$.
The function SumTran from $\left.: \operatorname{Seg}_{M} 5,\{0,1\}:\right]$ into $: \operatorname{Seg}_{M} 5,\{0,1\},\{-1,0,1\}$ : is defined as follows:
(Def. 12) SumTran $\left.=\operatorname{id}\left(: \operatorname{Seg}_{M} 5,\{0,1\}:\right],\{-1,0,1\}, 0\right)+\cdot(\langle 0,0\rangle \longmapsto\langle 0,0,1\rangle)+\cdot(\langle 0$, $1\rangle \stackrel{\rightharpoonup}{\longmapsto}\langle 1,0,1\rangle)+\cdot(\langle 1,1\rangle \mapsto\langle 1,1,1\rangle)+\cdot(\langle 1,0\rangle \mapsto\langle 2,1,1\rangle)+\cdot(\langle 2,1\rangle \mapsto\langle 2$, $1,1\rangle)+\cdot(\langle 2,0\rangle \stackrel{\rightharpoonup}{\longmapsto}\langle 3,0,-1\rangle)+\cdot(\langle 3,1\rangle \mapsto\langle 4,0,-1\rangle)+\cdot(\langle 4,1\rangle \mapsto\langle 4,1$, $-1\rangle)+\cdot(\langle 4,0\rangle \stackrel{\rightharpoonup}{\longmapsto}\langle 5,0,0\rangle)$.
Next we state the proposition
(17) $\operatorname{Sum} \operatorname{Tran}(\langle 0,0\rangle)=\langle 0,0,1\rangle$ and $\operatorname{SumTran}(\langle 0,1\rangle)=\langle 1,0,1\rangle$ and $\operatorname{SumTran}(\langle 1,1\rangle)=\langle 1,1,1\rangle$ and $\operatorname{SumTran}(\langle 1,0\rangle)=\langle 2,1,1\rangle$ and $\operatorname{SumTran}(\langle 2,1\rangle)=\langle 2,1,1\rangle$ and $\operatorname{SumTran}(\langle 2,0\rangle)=\langle 3,0,-1\rangle$ and $\operatorname{SumTran}(\langle 3,1\rangle)=\langle 4,0,-1\rangle$ and $\operatorname{SumTran}(\langle 4,1\rangle)=\langle 4,1,-1\rangle$ and $\operatorname{SumTran}(\langle 4,0\rangle)=\langle 5,0,0\rangle$.
Let $T$ be a Turing machine structure, let $t$ be a tape of $T$, and let $i, j$ be integers. We say that $t$ is 1 between $i, j$ if and only if:
(Def. 13) $\quad t(i)=0$ and $t(j)=0$ and for every integer $k$ such that $i<k$ and $k<j$ holds $t(k)=1$.
Let $f$ be a finite sequence of elements of $\mathbb{N}$, let $T$ be a Turing machine structure, and let $t$ be a tape of $T$. We say that $t$ stores data $f$ if and only if:
(Def. 14) For every natural number $i$ such that $1 \leqslant i$ and $i<\operatorname{len} f$ holds $t$ is 1 between $\sum \operatorname{Prefix}(f, i)+2 \cdot(i-1), \sum \operatorname{Prefix}(f, i+1)+2 \cdot i$.
We now state several propositions:
(18) Let $T$ be a Turing machine structure, $t$ be a tape of $T$, and $s, n$ be natural numbers. If $t$ stores data $\langle s, n\rangle$, then $t$ is 1 between $s, s+n+2$.
(19) Let $T$ be a Turing machine structure, $t$ be a tape of $T$, and $s, n$ be natural numbers. If $t$ is 1 between $s, s+n+2$, then $t$ stores data $\langle s, n\rangle$.
(20) Let $T$ be a Turing machine structure, $t$ be a tape of $T$, and $s, n$ be natural numbers. Suppose $t$ stores data $\langle s, n\rangle$. Then $t(s)=0$ and $t(s+n+2)=0$ and for every integer $i$ such that $s<i$ and $i<s+n+2$ holds $t(i)=1$.
(21) Let $T$ be a Turing machine structure, $t$ be a tape of $T$, and $s, n_{1}, n_{2}$ be natural numbers. Suppose $t$ stores data $\left\langle s, n_{1}, n_{2}\right\rangle$. Then $t$ is 1 between $s$, $s+n_{1}+2$ and 1 between $s+n_{1}+2, s+n_{1}+n_{2}+4$.
(22) Let $T$ be a Turing machine structure, $t$ be a tape of $T$, and $s, n_{1}, n_{2}$ be natural numbers. Suppose $t$ stores data $\left\langle s, n_{1}, n_{2}\right\rangle$. Then
(i) $t(s)=0$,
(ii) $t\left(s+n_{1}+2\right)=0$,
(iii) $t\left(s+n_{1}+n_{2}+4\right)=0$,
(iv) for every integer $i$ such that $s<i$ and $i<s+n_{1}+2$ holds $t(i)=1$, and
(v) for every integer $i$ such that $s+n_{1}+2<i$ and $i<s+n_{1}+n_{2}+4$ holds $t(i)=1$.
(23) Let $f$ be a finite sequence of elements of $\mathbb{N}$ and $s$ be a natural number. If len $f \geqslant 1$, then $\sum \operatorname{Prefix}(\langle s\rangle \frown f, 1)=s$ and $\sum \operatorname{Prefix}\left(\langle s\rangle^{\frown} f, 2\right)=s+f_{1}$.
(24) Let $f$ be a finite sequence of elements of $\mathbb{N}$ and $s$ be a natural number. Suppose len $f \geqslant 3$. Then $\sum \operatorname{Prefix}\left(\langle s\rangle^{\wedge} f, 1\right)=s$ and $\sum \operatorname{Prefix}\left(\langle s\rangle^{\wedge} f, 2\right)=$ $s+f_{1}$ and $\sum \operatorname{Prefix}(\langle s\rangle \wedge f, 3)=s+f_{1}+f_{2}$ and $\sum \operatorname{Prefix}(\langle s\rangle \wedge f, 4)=$ $s+f_{1}+f_{2}+f_{3}$.
(25) Let $T$ be a Turing machine structure, $t$ be a tape of $T, s$ be a natural number, and $f$ be a finite sequence of elements of $\mathbb{N}$. If len $f \geqslant 1$ and $t$ stores data $\langle s\rangle \wedge f$, then $t$ is 1 between $s, s+f_{1}+2$.
(26) Let $T$ be a Turing machine structure, $t$ be a tape of $T, s$ be a natural number, and $f$ be a finite sequence of elements of $\mathbb{N}$. Suppose len $f \geqslant 3$ and $t$ stores data $\langle s\rangle \sim f$. Then $t$ is 1 between $s, s+f_{1}+2,1$ between $s+f_{1}+2, s+f_{1}+f_{2}+4$, and 1 between $s+f_{1}+f_{2}+4, s+f_{1}+f_{2}+f_{3}+6$.

## 3. Summation of Two Natural Numbers

The strict Turing machine structure SumTuring is defined by the conditions (Def. 15).
$($ Def. 15)(i) The symbols of SumTuring $=\{0,1\}$,
(ii) the control states of SumTuring $=\operatorname{Seg}_{M} 5$,
(iii) the transition of SumTuring $=$ SumTran,
(iv) the initial state of SumTuring $=0$, and
(v) the accepting state of SumTuring $=5$.

Next we state several propositions:
(27) Let $T$ be a Turing machine structure, $s$ be a State of $T$, and $p, h, t$ be sets. If $s=\langle p, h, t\rangle$, then $\operatorname{Head}(s)=h$.
(28) Let $T$ be a Turing machine structure, $t$ be a tape of $T, h$ be an integer, and $s$ be a symbol of $T$. If $t(h)=s$, then $\operatorname{Tape-Chg}(t, h, s)=t$.
(29) Let $T$ be a Turing machine structure, $s$ be a State of $T$, and $p, h, t$ be sets. Suppose $s=\langle p, h, t\rangle$ and $p \neq$ the accepting state of $T$. Then Following $(s)=\left\langle s-\operatorname{target}_{\mathbf{1}}, \operatorname{Head}(s)+\operatorname{offset}(s\right.$-target $)$, Tape-Chg $\left(s_{\mathbf{3}}, \operatorname{Head}(s), s\right.$ - $\left.\left.\operatorname{target}_{\mathbf{2}}\right)\right\rangle$.
(30) Let $T$ be a Turing machine structure, $t$ be a tape of $T, h$ be an integer, $s$ be a symbol of $T$, and $i$ be a set. Then $(\operatorname{Tape}-\operatorname{Chg}(t, h, s))(h)=s$ and if $i \neq h$, then $(\operatorname{Tape}-\operatorname{Chg}(t, h, s))(i)=t(i)$.
(31) Let $s$ be a State of SumTuring, $t$ be a tape of SumTuring, and $h_{1}, n_{1}$, $n_{2}$ be natural numbers. Suppose $s=\left\langle 0, h_{1}, t\right\rangle$ and $t$ stores data $\left\langle h_{1}, n_{1}\right.$, $\left.n_{2}\right\rangle$. Then $s$ is accepting and $(\operatorname{Result}(s))_{\mathbf{2}}=1+h_{1}$ and $(\operatorname{Result}(s))_{\mathbf{3}}$ stores data $\left\langle 1+h_{1}, n_{1}+n_{2}\right\rangle$.
Let $T$ be a Turing machine structure and let $F$ be a function. We say that $T$ computes $F$ if and only if the condition (Def. 16) is satisfied.
(Def. 16) Let $s$ be a State of $T, t$ be a tape of $T, a$ be a natural number, and $x$ be a finite sequence of elements of $\mathbb{N}$. Suppose $x \in \operatorname{dom} F$ and $s=\langle$ the initial state of $T, a, t\rangle$ and $t$ stores data $\langle a\rangle{ }^{\wedge} x$. Then $s$ is accepting and there exist natural numbers $b, y$ such that $(\operatorname{Result}(s))_{2}=b$ and $y=F(x)$ and $(\operatorname{Result}(s))_{3}$ stores data $\langle b\rangle{ }^{\wedge}\langle y\rangle$.
Next we state two propositions:
(32) $\operatorname{dom}[+] \subseteq \mathbb{N}^{2}$.
(33) SumTuring computes [ + ].

## 4. Computing Successor Function

The function SuccTran from $\left.: \operatorname{Seg}_{M} 4,\{0,1\}:\right]$ into $: \operatorname{Seg}_{M} 4,\{0,1\},\{-1,0,1\}:$ is defined as follows:
(Def. 17) $\operatorname{SuccTran}=\operatorname{id}\left(\left\{\operatorname{Seg}_{M} 4,\{0,1\}:,\{-1,0,1\}, 0\right)+\cdot(\langle 0,0\rangle \mapsto\langle 1,0,1\rangle)+\cdot(\langle 1\right.$, $1\rangle \longmapsto\langle 1,1,1\rangle)+\cdot(\langle 1,0\rangle \longmapsto\langle 2,1,1\rangle)+\cdot(\langle 2,0\rangle \longmapsto\langle 3,0,-1\rangle)+\cdot(\langle 2,1\rangle \longmapsto\langle 3$, $0,-1\rangle)+\cdot(\langle 3,1\rangle \mapsto\langle 3,1,-1\rangle)+\cdot(\langle 3,0\rangle \longmapsto\langle 4,0,0\rangle)$.
We now state the proposition
(34) $\operatorname{SuccTran}(\langle 0,0\rangle)=\langle 1,0,1\rangle$ and $\operatorname{SuccTran}(\langle 1,1\rangle)=\langle 1,1,1\rangle$ and $\operatorname{SuccTran}(\langle 1,0\rangle)=\langle 2,1,1\rangle$ and $\operatorname{SuccTran}(\langle 2,0\rangle)=\langle 3,0,-1\rangle$ and $\operatorname{SuccTran}(\langle 2,1\rangle)=\langle 3,0,-1\rangle$ and $\operatorname{SuccTran}(\langle 3,1\rangle)=\langle 3,1,-1\rangle$ and $\operatorname{SuccTran}(\langle 3,0\rangle)=\langle 4,0,0\rangle$.
The strict Turing machine structure SuccTuring is defined by the conditions (Def. 18).
(Def. 18)(i) The symbols of SuccTuring $=\{0,1\}$,
(ii) the control states of SuccTuring $=\operatorname{Seg}_{M} 4$,
(iii) the transition of SuccTuring $=$ SuccTran,
(iv) the initial state of SuccTuring $=0$, and
(v) the accepting state of SuccTuring $=4$.

The following propositions are true:
$(36)^{1}$ Let $s$ be a State of SuccTuring, $t$ be a tape of SuccTuring, and $h_{1}, n$ be natural numbers. Suppose $s=\left\langle 0, h_{1}, t\right\rangle$ and $t$ stores data $\left\langle h_{1}, n\right\rangle$. Then $s$ is accepting and $(\operatorname{Result}(s))_{\mathbf{2}}=h_{1}$ and $(\operatorname{Result}(s))_{\mathbf{3}}$ stores data $\left\langle h_{1}, n+1\right\rangle$.
(37) SuccTuring computes $\operatorname{succ}_{1}(1)$.

## 5. Computing Zero Function

The function ZeroTran from $\left.: \operatorname{Seg}_{M} 4,\{0,1\}:\right]$ into $\left.: \operatorname{Seg}_{M} 4,\{0,1\},\{-1,0,1\}\right]$ is defined as follows:
(Def. 19) ZeroTran $=\operatorname{id}\left(\left\{\operatorname{Seg}_{M} 4,\{0,1\}:,\{-1,0,1\}, 1\right)+\cdot(\langle 0,0\rangle \mapsto\langle 1,0,1\rangle)+\cdot(\langle 1\right.$, $1\rangle \longmapsto\langle 2,1,1\rangle)+\cdot(\langle 2,0\rangle \longmapsto\langle 3,0,-1\rangle)+\cdot(\langle 2,1\rangle \longmapsto\langle 3,0,-1\rangle)+\cdot$ $(\langle 3,1\rangle \longmapsto\langle 4,1,-1\rangle)$.
Next we state the proposition
(38) $\operatorname{ZeroTran}(\langle 0,0\rangle)=\langle 1,0,1\rangle$ and $\operatorname{ZeroTran}(\langle 1,1\rangle)=\langle 2,1,1\rangle$ and $\operatorname{ZeroTran}(\langle 2,0\rangle)=\langle 3,0,-1\rangle$ and $\operatorname{ZeroTran}(\langle 2,1\rangle)=\langle 3,0,-1\rangle$ and $\operatorname{ZeroTran}(\langle 3,1\rangle)=\langle 4,1,-1\rangle$.
The strict Turing machine structure ZeroTuring is defined by the conditions (Def. 20).
(Def. 20)(i) The symbols of ZeroTuring $=\{0,1\}$,
(ii) the control states of ZeroTuring $=\operatorname{Seg}_{M} 4$,
(iii) the transition of ZeroTuring $=$ ZeroTran,
(iv) the initial state of ZeroTuring $=0$, and
(v) the accepting state of ZeroTuring $=4$.

We now state two propositions:

[^0](39) Let $s$ be a State of ZeroTuring, $t$ be a tape of ZeroTuring, $h_{1}$ be a natural number, and $f$ be a finite sequence of elements of $\mathbb{N}$. Suppose len $f \geqslant 1$ and $s=\left\langle 0, h_{1}, t\right\rangle$ and $t$ stores data $\left\langle h_{1}\right\rangle \frown f$. Then $s$ is accepting and $(\operatorname{Result}(s))_{\mathbf{2}}=h_{1}$ and $(\operatorname{Result}(s))_{\mathbf{3}}$ stores data $\left\langle h_{1}, 0\right\rangle$.
(40) If $n \geqslant 1$, then ZeroTuring computes $\operatorname{const}_{n}(0)$.

## 6. Computing $n$-Ary Project Function

The function $n$-proj3Tran from $: \operatorname{Seg}_{M} 3,\{0,1\}:$ into
$\left[: \operatorname{Seg}_{M} 3,\{0,1\},\{-1,0,1\}:\right]$ is defined by:
(Def. 21) $n$-proj3Tran $=\quad \operatorname{id}\left(\left[: \operatorname{Seg}_{M} 3,\{0,1\}:\right],\{-1,0,1\}, 0\right)+\cdot(\langle 0,0\rangle \longmapsto\langle 1,0$, $1\rangle)+\cdot(\langle 1,1\rangle \mapsto\langle 1,0,1\rangle)+\cdot(\langle 1,0\rangle \longmapsto\langle 2,0,1\rangle)+\cdot(\langle 2,1\rangle \mapsto\langle 2,0,1\rangle)+\cdot(\langle 2$, $0\rangle \stackrel{\rightharpoonup}{\longmapsto}\langle 3,0,0\rangle)$.
The following proposition is true
(41) $n-\operatorname{proj} 3 \operatorname{Tran}(\langle 0,0\rangle)=\langle 1,0,1\rangle$ and $n-\operatorname{proj} 3 \operatorname{Tran}(\langle 1,1\rangle)=\langle 1,0,1\rangle$ and $n-\operatorname{proj} 3 \operatorname{Tran}(\langle 1,0\rangle)=\langle 2,0,1\rangle$ and $n-\operatorname{proj} 3 \operatorname{Tran}(\langle 2,1\rangle)=\langle 2,0,1\rangle$ and $n-\operatorname{proj} 3 \operatorname{Tran}(\langle 2,0\rangle)=\langle 3,0,0\rangle$.
The strict Turing machine structure $n$-proj3Turing is defined by the conditions (Def. 22).
(Def. 22)(i) The symbols of $n$-proj3Turing $=\{0,1\}$,
(ii) the control states of $n$-proj3Turing $=\operatorname{Seg}_{M} 3$,
(iii) the transition of $n$-proj3Turing $=n$-proj3Tran,
(iv) the initial state of $n$-proj3Turing $=0$, and
(v) the accepting state of $n$-proj3Turing $=3$.

Next we state two propositions:
(42) Let $s$ be a State of $n$-proj3Turing, $t$ be a tape of $n$-proj3Turing, $h_{1}$ be a natural number, and $f$ be a finite sequence of elements of $\mathbb{N}$. Suppose len $f \geqslant 3$ and $s=\left\langle 0, h_{1}, t\right\rangle$ and $t$ stores data $\left\langle h_{1}\right\rangle^{\wedge} f$. Then $s$ is accepting and $(\operatorname{Result}(s))_{\mathbf{2}}=h_{1}+f_{1}+f_{2}+4$ and $(\operatorname{Result}(s))_{\mathbf{3}}$ stores data $\left\langle h_{1}+\right.$ $\left.f_{1}+f_{2}+4, f_{3}\right\rangle$.
(43) If $n \geqslant 3$, then $n$-proj3Turing computes $\operatorname{proj}_{n}(3)$.

## 7. Combining Two Turing Machines into One

Let $t_{1}, t_{2}$ be Turing machine structures. The functor $\operatorname{Seq} \operatorname{States}\left(t_{1}, t_{2}\right)$ yielding a finite non empty set is defined by the condition (Def. 23).
(Def. 23) SeqStates $\left(t_{1}, t_{2}\right)=\left[\right.$ the control states of $t_{1}$, \{the initial state of $\left.\left.t_{2}\right\}:\right] \cup$ : : $\left\{\right.$ the accepting state of $\left.t_{1}\right\}$, the control states of $t_{2}$ :].

One can prove the following four propositions:
(44) Let $t_{1}, t_{2}$ be Turing machine structures. Then
(i) $\left\langle\right.$ the initial state of $t_{1}$, the initial state of $\left.t_{2}\right\rangle \in \operatorname{SeqStates}\left(t_{1}, t_{2}\right)$, and
(ii) 〈the accepting state of $t_{1}$, the accepting state of $\left.t_{2}\right\rangle \in \operatorname{Seq} \operatorname{States}\left(t_{1}, t_{2}\right)$.
(45) For all Turing machine structures $s, t$ and for every state $x$ of $s$ holds $\langle x$, the initial state of $t\rangle \in \operatorname{Seq} \operatorname{States}(s, t)$.
(46) For all Turing machine structures $s, t$ and for every state $x$ of $t$ holds $\langle$ the accepting state of $s, x\rangle \in \operatorname{SeqStates}(s, t)$.
(47) Let $s, t$ be Turing machine structures and $x$ be an element of $\operatorname{SeqStates}(s, t)$. Then there exists a state $x_{1}$ of $s$ and there exists a state $x_{2}$ of $t$ such that $x=\left\langle x_{1}, x_{2}\right\rangle$.
Let $s, t$ be Turing machine structures and let $x$ be a transition-target of $s$. The functor $1^{\text {st }} \operatorname{Seq} \operatorname{Tran}(s, t, x)$ yielding an element of $: \operatorname{SeqStates}(s, t)$, (the symbols of $s) \cup($ the symbols of $t),\{-1,0,1\}:$ is defined as follows:
(Def. 24) $1^{\text {st }} \operatorname{Seq} \operatorname{Tran}(s, t, x)=\left\langle\left\langle x_{\mathbf{1}}\right.\right.$, the initial state of $\left.\left.t\right\rangle, x_{\mathbf{2}}, x_{\mathbf{3}}\right\rangle$.
Let $s, t$ be Turing machine structures and let $x$ be a transition-target of $t$. The functor $2^{\text {nd }} \operatorname{Seq} \operatorname{Tran}(s, t, x)$ yielding an element of : $\operatorname{Seq} \operatorname{States}(s, t)$, (the symbols of $s) \cup($ the symbols of $t),\{-1,0,1\}$ : is defined as follows:
(Def. 25) $2^{\text {nd }} \operatorname{Seq} \operatorname{Tran}(s, t, x)=\left\langle\left\langle\right.\right.$ the accepting state of $\left.\left.s, x_{\mathbf{1}}\right\rangle, x_{\mathbf{2}}, x_{3}\right\rangle$.
Let $s, t$ be Turing machine structures and let $x$ be an element of $\operatorname{Seq} \operatorname{States}(s, t)$. Then $x_{1}$ is a state of $s$. Then $x_{2}$ is a state of $t$.

Let $s, t$ be Turing machine structures and let $x$ be an element of : $\operatorname{Seq} \operatorname{States}(s, t)$, (the symbols of $s) \cup($ the symbols of $t):$. The functor $1^{\text {st }} S$ SeqState $x$ yields a state of $s$ and is defined by:
(Def. 26) $1^{\text {st }}$ SeqState $x=\left(x_{\mathbf{1}}\right)_{\mathbf{1}}$.
The functor $2^{\text {nd }}$ SeqState $x$ yielding a state of $t$ is defined as follows:
(Def. 27) $2^{\text {nd }}$ SeqState $x=\left(x_{1}\right)_{2}$.
Let $X, Y, Z$ be non empty sets and let $x$ be an element of $: X, Y \cup Z:$. Let us assume that there exist a set $u$ and an element $y$ of $Y$ such that $x=\langle u, y\rangle$. The functor $1^{\text {st }}$ SeqSymbol $x$ yielding an element of $Y$ is defined as follows:
(Def. 28) $1^{\text {st }}$ SeqSymbol $x=x_{\mathbf{2}}$.
Let $X, Y, Z$ be non empty sets and let $x$ be an element of $: X, Y \cup Z:$. Let us assume that there exist a set $u$ and an element $z$ of $Z$ such that $x=\langle u, z\rangle$. The functor $2^{\text {nd }}$ SeqSymbol $x$ yielding an element of $Z$ is defined by:
(Def. 29) $2^{\text {nd }}$ SeqSymbol $x=x_{\mathbf{2}}$.
Let $s, t$ be Turing machine structures and let $x$ be an element of : $\operatorname{Seq} \operatorname{States}(s, t)$, (the symbols of $s) \cup($ the symbols of $t)$ :. The functor $\operatorname{Seq} \operatorname{Tran}(s, t, x)$ yielding an element of : $\operatorname{SeqStates}(s, t)$, (the symbols of $s) \cup($ the symbols of $t),\{-1,0,1\}:]$ is defined by:
(Def. 30) $\operatorname{Seq} \operatorname{Tran}(s, t, x)=\left\{\begin{array}{c}1^{\text {st }} \operatorname{Seq} \operatorname{Tran}\left(s, t,(\text { the transition of } s)\left(\left\langle 1^{\text {st }} \text { SeqState } x,\right.\right.\right. \\ \left.\left.\left.1^{\text {st }} \operatorname{Seq} \operatorname{Symbol} x\right\rangle\right)\right) \text {, if there exists a state } p \text { of } s \\ \text { and there exists a symbol } y \text { of } s \text { such that } x= \\ \langle\langle p, \text { the initial state of } t\rangle, y\rangle \text { and } p \neq \text { the accepting } \\ \text { state of } s, \\ 2^{\text {nd }} \operatorname{SeqTran}\left(s, t,(\text { the transition of } t)\left(\left\langle 2^{\text {nd }} \text { SeqState } x,\right.\right.\right. \\ \left.\left.\left.2^{\text {nd }} \operatorname{SeqSymbol} x\right\rangle\right)\right) \text {, if there exists a state } q \text { of } t \\ \text { and there exists a symbol } y \text { of } t \text { such that } x= \\ \langle\langle\text { the accepting state of } s, q\rangle, y\rangle, \\ \left\langle x_{\mathbf{1}}, x_{\mathbf{2}},-1\right\rangle, \text { otherwise. }\end{array}\right.$
Let $s, t$ be Turing machine structures. The functor $\operatorname{SeqTan}(s, t)$ yielding a function from $: \operatorname{SeqStates}(s, t)$, (the symbols of $s) \cup($ the symbols of $t)$ : into : : SeqStates $(s, t)$, (the symbols of $s) \cup($ the symbols of $t),\{-1,0,1\}:$ is defined by:
(Def. 31) For every element $x$ of : SeqStates $(s, t)$, (the symbols of $s) \cup$ (the symbols of $t$ ): holds $(\operatorname{Seq} \operatorname{Tran}(s, t))(x)=\operatorname{SeqTran}(s, t, x)$.
Let $T_{1}, T_{2}$ be Turing machine structures. The functor $T_{1} ; T_{2}$ yielding a strict Turing machine structure is defined by the conditions (Def. 32).
(Def. 32)(i) The symbols of $T_{1} ; T_{2}=\left(\right.$ the symbols of $\left.T_{1}\right) \cup\left(\right.$ the symbols of $\left.T_{2}\right)$,
(ii) the control states of $T_{1} ; T_{2}=\operatorname{SeqStates}\left(T_{1}, T_{2}\right)$,
(iii) the transition of $T_{1} ; T_{2}=\operatorname{Seq} \operatorname{Tran}\left(T_{1}, T_{2}\right)$,
(iv) the initial state of $T_{1} ; T_{2}=\left\langle\right.$ the initial state of $T_{1}$, the initial state of $\left.T_{2}\right\rangle$, and
(v) the accepting state of $T_{1} ; T_{2}=\left\langle\right.$ the accepting state of $T_{1}$, the accepting state of $\left.T_{2}\right\rangle$.
We now state several propositions:
(48) Let $T_{1}, T_{2}$ be Turing machine structures, $g$ be a transition-target of $T_{1}$, $p$ be a state of $T_{1}$, and $y$ be a symbol of $T_{1}$. Suppose $p \neq$ the accepting state of $T_{1}$ and $g=\left(\right.$ the transition of $\left.T_{1}\right)(\langle p, y\rangle)$. Then (the transition of $\left.T_{1} ; T_{2}\right)\left(\left\langle\left\langle p\right.\right.\right.$, the initial state of $\left.\left.\left.T_{2}\right\rangle, y\right\rangle\right)=\left\langle\left\langle g_{1}\right.\right.$, the initial state of $\left.T_{2}\right\rangle, g_{2}$, $\left.g_{3}\right\rangle$.
(49) Let $T_{1}, T_{2}$ be Turing machine structures, $g$ be a transition-target of $T_{2}$, $q$ be a state of $T_{2}$, and $y$ be a symbol of $T_{2}$. Suppose $g=$ (the transition of $\left.T_{2}\right)(\langle q, y\rangle)$. Then (the transition of $\left.T_{1} ; T_{2}\right)\left(\left\langle\left\langle\right.\right.\right.$ the accepting state of $T_{1}$, $q\rangle, y\rangle)=\left\langle\left\langle\right.\right.$ the accepting state of $\left.\left.T_{1}, g_{1}\right\rangle, g_{\mathbf{2}}, g_{3}\right\rangle$.
(50) Let $T_{1}, T_{2}$ be Turing machine structures, $s_{1}$ be a State of $T_{1}, h$ be a natural number, $t$ be a tape of $T_{1}, s_{2}$ be a State of $T_{2}$, and $s_{3}$ be a State of $T_{1} ; T_{2}$. Suppose that
(i) $s_{1}$ is accepting,
(ii) $s_{1}=\left\langle\right.$ the initial state of $\left.T_{1}, h, t\right\rangle$,
(iii) $s_{2}$ is accepting,
(iv) $s_{2}=\left\langle\right.$ the initial state of $\left.T_{2},\left(\operatorname{Result}\left(s_{1}\right)\right)_{\mathbf{2}},\left(\operatorname{Result}\left(s_{1}\right)\right)_{\mathbf{3}}\right\rangle$, and
(v) $s_{3}=\left\langle\right.$ the initial state of $\left.T_{1} ; T_{2}, h, t\right\rangle$.

Then $s_{3}$ is accepting and $\left(\operatorname{Result}\left(s_{3}\right)\right)_{\mathbf{2}}=\left(\operatorname{Result}\left(s_{2}\right)\right)_{\mathbf{2}}$ and $\left(\operatorname{Result}\left(s_{3}\right)\right)_{\mathbf{3}}=\left(\operatorname{Result}\left(s_{2}\right)\right)_{\mathbf{3}}$.
(51) Let $t_{3}, t_{4}$ be Turing machine structures and $t$ be a tape of $t_{3}$. If the symbols of $t_{3}=$ the symbols of $t_{4}$, then $t$ is a tape of $t_{3} ; t_{4}$.
(52) Let $t_{3}, t_{4}$ be Turing machine structures and $t$ be a tape of $t_{3} ; t_{4}$. Suppose the symbols of $t_{3}=$ the symbols of $t_{4}$. Then $t$ is a tape of $t_{3}$ and a tape of $t_{4}$.
(53) Let $f$ be a finite sequence of elements of $\mathbb{N}, t_{3}, t_{4}$ be Turing machine structures, $t_{1}$ be a tape of $t_{3}$, and $t_{2}$ be a tape of $t_{4}$. If $t_{1}=t_{2}$ and $t_{1}$ stores data $f$, then $t_{2}$ stores data $f$.
(54) Let $s$ be a State of ZeroTuring; SuccTuring, $t$ be a tape of ZeroTuring, and $h_{1}, n$ be natural numbers. Suppose $s=\left\langle\langle 0,0\rangle, h_{1}, t\right\rangle$ and $t$ stores data $\left\langle h_{1}, n\right\rangle$. Then $s$ is accepting and $(\operatorname{Result}(s))_{\mathbf{2}}=h_{1}$ and $(\operatorname{Result}(s))_{\mathbf{3}}$ stores data $\left\langle h_{1}, 1\right\rangle$.
